

## Spime - The Next Generation and Patented Extension of Digital Twin

BaseN is the only global full stack IoT Platform enabling companies to transform their **physical products into intelligent services** through Spime, the next generation and patented extension of Digital Twin.

A Spime is the **complete logical software description and mastering reflection** of a physical object, typically a device or any other entity that performs a function, or series of functions, in a digital service. The Spime is defined and conceived **before the appearance of its physical counterpart**. In this sense, a Spime is independent of its physical representation, **which can come and go** and be easily replaced.

**BaseN operates and continuously develops its own full stack IoT Platform**

- Since 2001
- Fully owned IPR and architecture
- Deployed as Software-as-a-Service
- Designed to be real time, linearly scalable, fault tolerant and inherently distributed
- Suitable also for mission critical applications
- 24x7 SLAs provided to customers
- Transparent billing, pay as you grow
- Customers can deploy global products in days

**Processing over one million transactions per second out of 12 data centers globally**
